

Weak layers in the old snowpack necessitate caution

Edition: 16.11.2017, 17:00 / Next update: 17.11.2017, 17:00

Avalanche danger

region B **Level 2, moderate**

Snow drifts

Avalanche prone locations

Danger description

Thus far only a little snow is lying. Somewhat older snow drift accumulations are to be found in particular in gullies and bowls, and behind abrupt changes in the terrain. They are mostly small but can be released in isolated cases especially at their margins. The snow drift accumulations are clearly recognisable to the trained eye. They are to be evaluated with care and prudence in very steep terrain.
 In high Alpine regions avalanche prone locations are more prevalent and the danger is slightly greater.

Remarks

The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.
