

Increase in avalanche danger as a consequence of fresh snow and strong wind

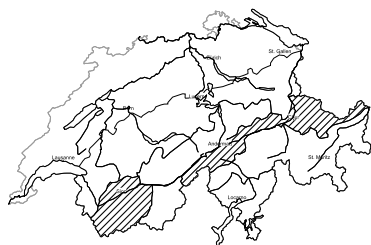

Edition: 18.11.2017, 17:00 / Next update: 19.11.2017, 17:00

Avalanche danger

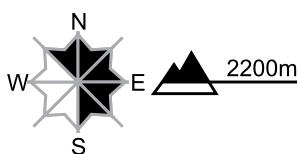

region C

Level 2, moderate

Snow drifts

Avalanche prone locations

Danger description

As the day progresses snow drift accumulations will form. These are rather small but can in some cases be released easily. They are to be avoided in steep terrain.

Old snow

In some places avalanches can be triggered in the old snow. Caution is to be exercised in particular at transitions from a shallow to a deep snowpack. The avalanche prone locations are barely recognisable, even to the trained eye. They are to be found in particular on steep west, north and east facing slopes.
