Avalanche danger

region C

Level 2, moderate

Snow drifts, old snow

Avalanche prone locations

Danger description

The snow drift accumulations of the last few days represent the main danger. These are to be found in particular in gullies and bowls, and behind abrupt changes in the terrain. They are small but in some cases prone to triggering. The snow drift accumulations are clearly recognisable to the trained eye. They are to be evaluated with care and prudence in steep terrain. Additionally in isolated cases avalanches can be released in the old snowpack. Caution is to be exercised in particular at transitions from a shallow to a deep snowpack. These avalanche prone locations are barely recognisable, even to the trained eye. They are to be found in particular on very steep shady slopes. Careful route selection is recommended.

Remarks

The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.
