

## Moderate avalanche danger will be encountered over a wide area

Edition: 23.11.2017, 17:00 / Next update: 24.11.2017, 17:00

### Avalanche danger

region B

Level 2, moderate

#### Snow drifts, old snow

##### Avalanche prone locations

##### Danger description

Fresh snow drift accumulations will form in particular at elevated altitudes. They are small but can be released easily. These are to be found in particular in gullies and bowls, and behind abrupt changes in the terrain. Additionally in isolated cases avalanches can be released in the old snowpack and reach medium size. This applies in particular on steep shady slopes. Careful route selection is recommended.

#### Full-depth avalanches

On steep grassy slopes full-depth avalanches are possible. Areas with glide cracks are to be avoided as far as possible.

#### Remarks

The Avalanche Warning Service currently has only a small amount of information that has been collected in the field, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.
