Avalanche danger

region B

Level 3, considerable

Snow drifts

Avalanche prone locations

Danger description

As a consequence of fresh snow and strong wind sometimes avalanche prone snow drift accumulations have formed. These are to be found in particular in gullies and bowls, and behind abrupt changes in the terrain. They can in some cases be released by a single winter sport participant. Avalanches can in isolated cases reach medium size. Ski touring and other off-piste activities, including snowshoe hiking, call for experience in the assessment of avalanche danger and careful route selection.

Remarks

The Avalanche Warning Service currently has only a small amount of information, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.
