Avalanche danger

region B

Level 2, moderate

Snow drifts

Avalanche prone locations

Danger description

As a consequence of the southwesterly wind further snow drift accumulations will form. Fresh and somewhat older snow drift accumulations are to be found in particular in gullies and bowls, and behind abrupt changes in the terrain. They can in some cases be released by a single winter sport participant, but they will be small in most cases. The snow drift accumulations are to be evaluated with care and prudence in steep terrain.

Remarks

The Avalanche Warning Service currently has only a small amount of information, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.

Danger levels

1 low

2 moderate

3 consider.

4 high

5 very high
