Avalanche danger

region C

Level 2, moderate

Snow drifts

Avalanche prone locations

Danger description

As a consequence of fresh snow and strong wind snow drift accumulations have formed. They are to be found in particular in gullies and bowls, and behind abrupt changes in the terrain. They can in some cases be released by a single winter sport participant, but they will be small in most cases. The snow drift accumulations are to be evaluated with care and prudence in steep terrain.

Old snow

In very isolated cases avalanches can be released in the old snowpack and reach medium size. This applies in particular on steep shady slopes. Careful route selection is recommended.

Remarks

The Avalanche Warning Service currently has only a small amount of information, so that the avalanche danger should be investigated especially thoroughly in the relevant locality.
