Avalanche danger

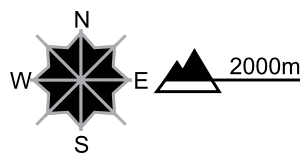

region G Level 2, moderate

Snow drifts, old snow

Avalanche prone locations

Danger description

The storm force wind will transport the fresh snow and, in some cases, old snow as well. The fresh and older snow drift accumulations can be released by a single winter sport participant in some cases. Mostly the avalanches are small. The number and size of avalanche prone locations will increase as the day progresses. Avalanches can in isolated cases be released in the old snowpack. This applies in particular on steep, little used slopes. These avalanche prone locations are rare. Careful route selection is recommended.
