

# In the southeast a high avalanche danger will be encountered in some regions

Edition: 12.12.2017, 08:00 / Next update: 12.12.2017, 17:00

## Avalanche danger

### region C Level 3, considerable

#### Fresh snow and snow drifts

##### Avalanche prone locations

##### Danger description

In the last few days extensive snow drift accumulations have formed. These remain prone to triggering. Single winter sport participants can release avalanches, including medium-sized ones. Only isolated natural avalanches are possible. Backcountry touring and other off-piste activities call for experience in the assessment of avalanche danger and caution.

#### Wet and full-depth avalanches

Full-depth avalanches are possible on steep grassy slopes. This applies in particular on steep east, south and west facing slopes below approximately 2400 m as well as on north facing slopes below approximately 2000 m. Areas with glide cracks are to be avoided as far as possible.

As the temperature drops there will be a gradual decrease in the danger of wet avalanches. Only isolated wet snow slides and avalanches are possible below approximately 2000 m.

#### Danger levels

1 low

2 moderate

3 consider.

4 high

5 very high
