Avalanche danger

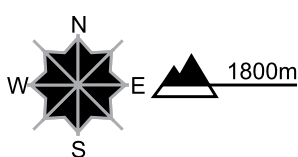

region C

Level 3, considerable

Fresh snow and snow drifts

Avalanche prone locations

Danger description

In the last few days extensive snow drift accumulations have formed. These remain prone to triggering. Single winter sport participants can release avalanches, including medium-sized ones. Only isolated natural avalanches are possible. Backcountry touring and other off-piste activities call for experience in the assessment of avalanche danger and caution.

Wet and full-depth avalanches

Full-depth avalanches are possible on steep grassy slopes. This applies in particular on steep east, south and west facing slopes below approximately 2400 m as well as on north facing slopes below approximately 2000 m. Areas with glide cracks are to be avoided as far as possible.

As the temperature drops there will be a gradual decrease in the danger of wet avalanches. Only isolated wet snow slides and avalanches are possible below approximately 2000 m.

Danger levels

1 low

2 moderate

3 consider.

4 high

5 very high
