Avalanche danger

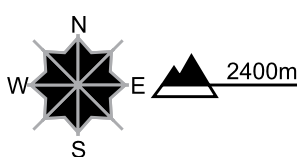

region B

Level 3, considerable

Snow drifts

Avalanche prone locations

Danger description

The older snow drift accumulations can especially at their margins be released by people. This applies especially on northwest, north and east facing slopes. Avalanches can reach medium size.

As a consequence of the northerly wind easily released snow drift accumulations have formed, in particular on south facing slopes at elevated altitudes.

Backcountry touring and other off-piste activities call for experience in the assessment of avalanche danger and careful route selection.

Full-depth avalanches

On steep grassy slopes small to medium-sized full-depth avalanches are to be expected. This applies in particular on steep east, south and west facing slopes below approximately 2400 m as well as on north facing slopes below approximately 2000 m. Areas with glide cracks are to be avoided as far as possible.

Danger levels

1 low

2 moderate

3 consider.

4 high

5 very high
