Avalanche danger

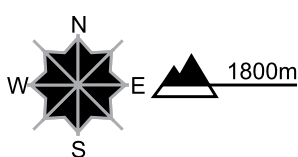

region C

Level 2, moderate

Snow drifts

Avalanche prone locations

Danger description

The older snow drift accumulations can at their margins be released, in particular by large loads. As a consequence of the northerly wind small snow drift accumulations have formed, in particular adjacent to the ridge line and in pass areas. They can in some cases be released easily. Backcountry touring and other off-piste activities call for careful route selection.

Full-depth avalanches

On steep grassy slopes small to medium-sized full-depth avalanches are to be expected. Areas with glide cracks are to be avoided as far as possible.

Danger levels

1 low

2 moderate

3 consider.

4 high

5 very high
