

# Considerable avalanche danger will be encountered in some regions

Edition: 23.12.2017, 17:00 / Next update: 24.12.2017, 08:00

## Avalanche danger

### region D

### Level 2, moderate

#### Old snow

#### Avalanche prone locations

#### Danger description

Avalanches can be released in near-surface layers, in particular by large additional loads. The avalanche prone locations are to be found in particular at transitions from a shallow to a deep snowpack, when entering gullies and bowls for example. They are rather rare but barely recognisable, even to the trained eye. Careful route selection is recommended.

#### Wet and full-depth avalanches

On steep grassy slopes more small and medium-sized full-depth avalanches are to be expected. This applies in particular on steep east, south and west facing slopes below approximately 2400 m as well as on north facing slopes below approximately 2000 m. Areas with glide cracks are to be avoided.

On extremely steep sunny slopes moist snow slides are to be expected as the day progresses.

#### Danger levels

1 low

2 moderate

3 consider.

4 high

5 very high
