Avalanche danger

region C

Level 2, moderate

Old snow

Avalanche prone locations

Danger description

Avalanches can be released in near-surface layers, in particular by large additional loads. The avalanche prone locations are to be found in particular at transitions from a shallow to a deep snowpack, when entering gullies and bowls for example. They are rather rare but barely recognisable, even to the trained eye. Careful route selection is recommended.

Wet and full-depth avalanches

On steep grassy slopes more small and medium-sized full-depth avalanches are to be expected. This applies in particular on steep east, south and west facing slopes below approximately 2400 m as well as on north facing slopes below approximately 2000 m. Areas with glide cracks are to be avoided.

Danger levels

1 low

2 moderate

3 consider.

4 high

5 very high
