

# A generally favourable avalanche situation will prevail

Edition: 25.12.2017, 17:00 / Next update: 26.12.2017, 08:00

## Avalanche danger

**region C** **Level 2, moderate**

### Snow drifts, old snow

#### Avalanche prone locations

#### Danger description

The fresh and somewhat older snow drift accumulations can be released, especially at their margins,. The fresh snow drift accumulations are rather small. The avalanche prone locations are to be found in particular at transitions from a shallow to a deep snowpack, when entering gullies and bowls for example. Careful route selection is recommended.

### Full-depth avalanches

On steep grassy slopes more small and medium-sized full-depth avalanches are possible. This applies in particular on steep east, south and west facing slopes below approximately 2400 m as well as on north facing slopes below approximately 2000 m. Areas with glide cracks are to be avoided as far as possible.
