

# In the west and in the north a high avalanche danger will be encountered over a wide area

Edition: 30.12.2017, 08:00 / Next update: 30.12.2017, 17:00

## Avalanche danger

### region C

### Level 3, considerable

### Fresh snow and snow drifts, old snow

#### Avalanche prone locations

#### Danger description

As a consequence of fresh snow and stormy weather further snow drift accumulations will form. These can be released by a single winter sport participant. They are to be bypassed.

Additionally in some places avalanches can be released in the old snowpack and reach dangerously large size. These avalanche prone locations are to be found in areas where the snow cover is rather shallow. This applies in particular on very steep west, north and east facing slopes. They are rather rare but barely recognisable, even to the trained eye. Whumpfung sounds can indicate the danger. Backcountry touring and other off-piste activities call for experience in the assessment of avalanche danger and caution.

### Wet and full-depth avalanches

In the afternoon mostly small full-depth and wet avalanches are possible below approximately 2000 m.

#### Danger levels

1 low

2 moderate

3 consider.

4 high

5 very high
