

# During the night a high avalanche danger will persist in some regions

Edition: 30.12.2017, 17:00 / Next update: 31.12.2017, 08:00

## Avalanche danger

### region C

### Level 3, considerable

### Fresh snow and snow drifts, old snow

#### Avalanche prone locations

#### Danger description

As a consequence of fresh snow and stormy weather extensive snow drift accumulations have formed. These can be released easily. Natural avalanches are possible in particular during the night. Additionally in some places avalanches can be released in the old snowpack and reach dangerously large size. These avalanche prone locations are to be found in areas where the snow cover is rather shallow. They are rather rare but barely recognisable, even to the trained eye. Whumpfung sounds can indicate the danger. Backcountry touring and other off-piste activities call for experience in the assessment of avalanche danger and caution.

### Wet and full-depth avalanches

Small and medium-sized full-depth and wet avalanches are to be expected below approximately 2200 m. Exposed parts of transportation routes can be endangered, this applies in particular during the night.

#### Danger levels

1 low

2 moderate

3 consider.

4 high

5 very high
