

Significant increase in avalanche danger as a consequence of fresh snow and stormy weather

Edition: 15.1.2018, 17:00 / Next update: 16.1.2018, 08:00

Avalanche danger

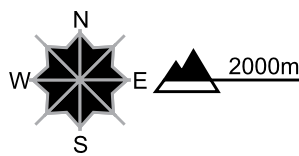

region F

Level 2, moderate

Snow drifts, old snow

Avalanche prone locations

Danger description

As a consequence of the sometimes storm force wind snow drift accumulations will form. These represent the main danger. Additionally in very isolated cases avalanches can also be released in the old snowpack, caution is to be exercised on very steep west, north and east facing slopes. Careful route selection is recommended.

Full-depth avalanches

Individual full-depth avalanches are possible. Caution is to be exercised in areas with glide cracks.
