

Very high avalanche danger will be encountered over a wide area

Edition: 22.1.2018, 17:00 / Next update: 23.1.2018, 08:00

Avalanche danger

region A **Level 5, very high**

Fresh snow and snow drifts, old snow

Avalanche prone locations

Danger description

The fresh snow and snow drift accumulations are prone to triggering. Until late in the night a large number of natural avalanches are to be expected. They can be triggered in deep layers and reach very large size. The avalanches can reach a long way. Exposed settlements and transportation routes are endangered in the majority of cases. Extensive safety measures are to be maintained during the night.

With the end of the precipitation, the natural avalanche activity will appreciably decrease. Individual avalanches are however still possible. These can as before reach large size.

Without question, it is inadvisable to engage in snow sport activities outside marked and open pistes.

Wet and full-depth avalanches

As a consequence of the rain wet avalanches are to be expected. This applies in particular during the night. At any time full-depth avalanches are possible, including quite large ones. This applies in all aspects below approximately 2200 m.
