Avalanche danger

region B

Level 3, considerable

Fresh snow and snow drifts

Avalanche prone locations

Danger description

Avalanches can be released in near-surface layers by people. This applies in particular in areas where the snow cover is rather shallow. Careful route selection and spacing between individuals are recommended. Fresh snow drift accumulations are mostly small but can be released easily. They are to be evaluated with care and prudence in steep terrain. Backcountry touring and other off-piste activities call for experience in the assessment of avalanche danger.

Full-depth avalanches

Below approximately 2400 m full-depth avalanches are to be expected, including large ones in isolated cases. This applies in particular on steep east, south and west facing slopes. They can be released at any time of day or night. Exposed parts of transportation routes can be endangered. Areas with glide cracks are to be avoided.
