

# A generally favourable avalanche situation will prevail. Full-depth avalanches on steep grassy slopes

Edition: 28.1.2018, 08:00 / Next update: 28.1.2018, 17:00

## Avalanche danger

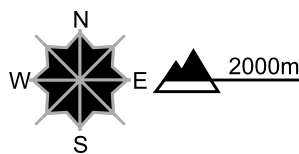

**region A**

**Level 2, moderate**

### Snow drifts

#### Avalanche prone locations

#### Danger description

Fresh and somewhat older snow drift accumulations represent the main danger. They are mostly only small but in some cases prone to triggering. Snow drift accumulations are to be assessed with care and prudence. At high altitudes and in high Alpine regions avalanche prone locations are more prevalent. Meticulous route selection is required.

### Full-depth avalanches

Below approximately 2200 m full-depth avalanches are possible. This applies in particular on steep east, south and west facing slopes. They can be released at any time of day or night. Areas with glide cracks are to be avoided as far as possible.
