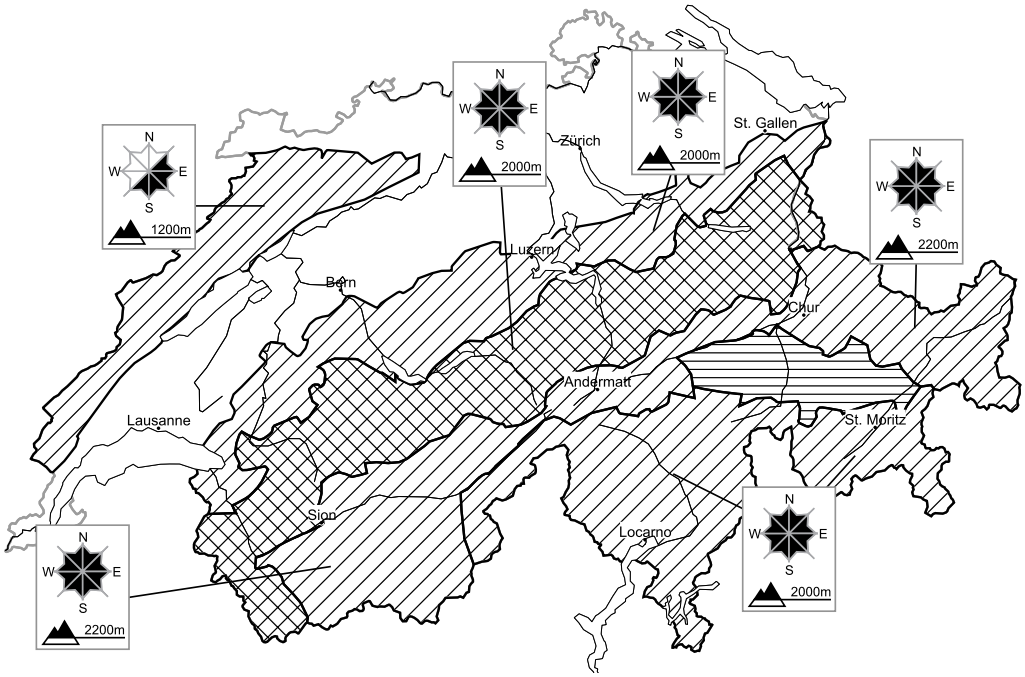
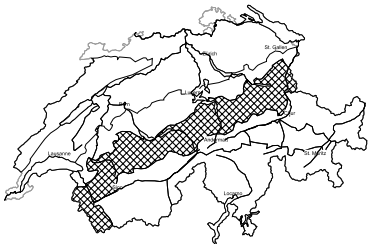
Avalanche danger

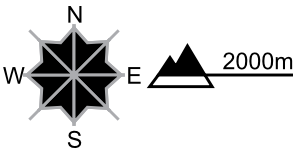


region A **Level 3, considerable**



Fresh snow and snow drifts

Avalanche prone locations



Danger description

As a consequence of fresh snow and wind snow drift accumulations will form. These can in some places be released easily, especially on steep north facing slopes. In particular in the regions exposed to heavier precipitation avalanches can in some cases reach dangerously large size. Experience in the assessment of avalanche danger is important. The snow drift accumulations are to be avoided especially in steep terrain.
