

# Considerable avalanche danger will be encountered in some regions

Edition: 21.2.2018, 08:00 / Next update: 21.2.2018, 17:00

## Avalanche danger

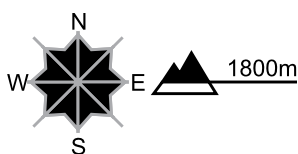

**region E**

**Level 2, moderate**

### Snow drifts

#### Avalanche prone locations

#### Danger description

As a consequence of the Bise wind easily released snow drift accumulations will form. They are mostly small. The snow drift accumulations are to be found in particular adjacent to the ridge line and in gullies and bowls. They are to be avoided in particular in very steep terrain. Older snow drift accumulations can be released in isolated cases. These avalanche prone locations are sometimes covered with fresh snow and difficult to recognise. Careful route selection is recommended.

### Full-depth avalanches

Isolated full-depth avalanches are possible in all aspects.

**Danger levels**

1 low

2 moderate

3 consider.

4 high

5 very high
