

Moderate avalanche danger will be encountered over a wide area

Edition: 26.2.2018, 17:00 / Next update: 27.2.2018, 08:00

Avalanche danger

region D **Level 2, moderate**

Snow drifts

Avalanche prone locations

Danger description

As a consequence of the northerly wind snow drift accumulations have formed. These are small but in some cases prone to triggering. They are to be evaluated with care and prudence in very steep terrain. Apart from the danger of being buried, restraint should be exercised also in view of the danger of avalanches sweeping people along and giving rise to falls.

Old snow

Weak layers in the upper part of the snowpack can be released by people in particular in little used backcountry terrain. This applies in particular above approximately 2400 m. These avalanche prone locations are rare but barely recognisable. Careful route selection is recommended.
