

# Considerable avalanche danger will be encountered in some regions

Edition: 9.3.2018, 08:00 / Next update: 9.3.2018, 17:00

## Avalanche danger

### region C

### Level 2, moderate

#### Snow drifts, old snow

#### Avalanche prone locations

#### Danger description

The more recent snow drift accumulations are mostly small but prone to triggering. The prevalence of avalanche prone locations will increase with altitude. Deeper layers of the snowpack can be released by a single winter sport participant in some places. Backcountry touring and other off-piste activities call for careful route selection.

#### Wet avalanches as day progresses, Full-depth avalanches

Valais: As a consequence of warming during the day and solar radiation individual full-depth and wet avalanches are possible. This applies in particular on very steep sunny slopes below approximately 2400 m.

#### Danger levels

1 low

2 moderate

3 consider.

4 high

5 very high
