

# Considerable avalanche danger will be encountered in some regions

Edition: 9.3.2018, 08:00 / Next update: 9.3.2018, 17:00

## Avalanche danger

region A

Level 3, considerable

### Snow drifts, old snow

#### Avalanche prone locations

#### Danger description

The more recent snow drift accumulations are prone to triggering. At elevated altitudes the prevalence and size of the avalanche prone locations will increase. Deeper layers of the snowpack can be released by a single winter sport participant in some places. These avalanche prone locations are covered with fresh snow and therefore barely recognisable. Backcountry touring and other off-piste activities call for experience in the assessment of avalanche danger.

### Full-depth avalanches, Wet avalanches as day progresses

As a consequence of warming during the day and solar radiation individual full-depth and wet avalanches are possible. This applies in particular on very steep sunny slopes below approximately 2400 m.

Danger levels

1 low

2 moderate

3 consider.

4 high

5 very high
