

# As a consequence of fresh snow a critical avalanche situation will be encountered in some regions

Edition: 18.3.2018, 08:00 / Next update: 18.3.2018, 17:00

## Avalanche danger

### region D

### Level 2, moderate

#### Old snow, snow drifts

##### Avalanche prone locations

##### Danger description

The older snow drift accumulations can especially at their margins be released by people. They are covered with fresh snow and therefore difficult to recognise. Careful route selection is recommended.

Fresh snow drift accumulations have formed in particular adjacent to the ridge line. They are only small but prone to triggering. They are to be avoided in extreme terrain.

#### Full-depth avalanches, Wet avalanches as day progresses

Below approximately 2400 m individual full-depth avalanches are possible, including quite large ones. Caution is to be exercised in areas with glide cracks.

In particular on rocky slopes moist snow slides are possible as a consequence of solar radiation.

#### Danger levels

1 low

2 moderate

3 consider.

4 high

5 very high
