

# Considerable avalanche danger will be encountered over a wide area. Fresh snow drifts require caution

Edition: 21.3.2018, 08:00 / Next update: 21.3.2018, 17:00

## Avalanche danger

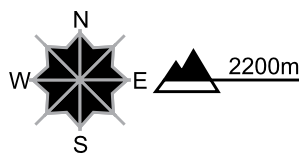

### region D

### Level 3, considerable

#### Snow drifts, old snow

#### Avalanche prone locations

#### Danger description

As a consequence of the northeasterly wind avalanche prone snow drift accumulations have formed. They are to be avoided in steep terrain. The number and size of avalanche prone locations will increase with altitude. Additionally in very isolated cases avalanches can also be triggered in the old snowpack and reach medium size. This applies in particular on steep, little used north facing slopes. Backcountry touring calls for experience in the assessment of avalanche danger and careful route selection.

#### Full-depth avalanches

Below approximately 2400 m individual full-depth avalanches are possible, including quite large ones. Caution is to be exercised in areas with glide cracks.
