Avalanche danger

region F

Level 2, moderate

Snow drifts

Avalanche prone locations

Danger description

Fresh snow drift accumulations are to be found in particular adjacent to the ridge line and in pass areas. They are mostly small but prone to triggering. At elevated altitudes avalanche prone locations are a little more prevalent. The fresh snow drift accumulations are to be evaluated with care and prudence in steep terrain. Old snow drift accumulations can be released in isolated cases, but mostly only by large additional loads. They are covered with fresh snow and therefore difficult to recognise. Careful route selection is recommended.

Full-depth avalanches

Below approximately 2400 m individual full-depth avalanches are possible, including quite large ones. Caution is to be exercised in areas with glide cracks.
