

In the southeast a considerable avalanche danger will prevail

Edition: 24.3.2018, 17:00 / Next update: 25.3.2018, 08:00

Avalanche danger

region B

Level 2, moderate

Old snow, snow drifts

Avalanche prone locations

Danger description

The snow drift accumulations of the last few days can be released, especially at their margins. Avalanches can additionally in isolated cases be released in deeper layers. This applies in particular on very steep north facing slopes in little used backcountry terrain. Such avalanche prone locations are barely recognisable. Careful route selection is recommended.

Wet avalanches as day progresses, Full-depth avalanches

As a consequence of warming during the day and solar radiation moist snow slides and avalanches are to be expected. Below approximately 2400 m individual full-depth avalanches are possible, including large ones in isolated cases. Caution is to be exercised in areas with glide cracks.

Danger levels

1 low

2 moderate

3 consider.

4 high

5 very high
