

Moderate avalanche danger will be encountered over a wide area

Edition: 26.3.2018, 17:00 / Next update: 27.3.2018, 08:00

Avalanche danger

region B **Level 2, moderate**

Snow drifts

Avalanche prone locations

Danger description

As a consequence of fresh snow and wind snow drift accumulations will form. These are in some cases prone to triggering. They are to be found in particular in gullies and bowls, and behind abrupt changes in the terrain. As the day progresses the previously small snow drift accumulations will increase in size. The number and size of avalanche prone locations will increase. Careful route selection is recommended. The fresh snow drift accumulations are to be avoided.

Full-depth avalanches

Below approximately 2400 m individual full-depth avalanches are possible. In many cases these are dangerously large. Caution is to be exercised in areas with glide cracks.
