Avalanche danger

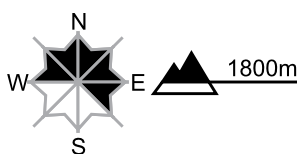

region C

Level 2, moderate

Snow drifts

Avalanche prone locations

Danger description

As a consequence of fresh snow and strong wind snow drift accumulations will form. These are mostly small but in some cases prone to triggering. They are to be found in particular in gullies and bowls, and behind abrupt changes in the terrain.

Careful route selection is recommended. The fresh snow drift accumulations are to be avoided.

Wet and full-depth avalanches

As a consequence of the rain moist snow slides are possible.

Full-depth avalanches can also occur. In some cases these are quite large. Caution is to be exercised in areas with glide cracks.

Danger levels

1 low

2 moderate

3 consider.

4 high

5 very high
