

Considerable danger of dry and wet avalanches will be encountered in some regions

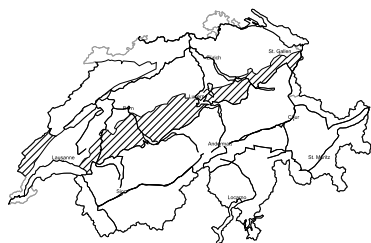

Edition: 28.3.2018, 17:00 / Next update: 29.3.2018, 08:00

Avalanche danger

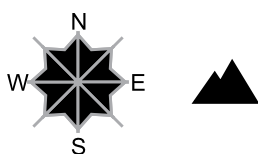

region F

Level 2, moderate

Wet and full-depth avalanches

Avalanche prone locations

Danger description

As a consequence of the rain full-depth and wet avalanches are possible. These can reach dangerously large size. Areas with glide cracks are to be avoided.

Snow drifts

Prealps: The fresh and somewhat older snow drift accumulations are mostly small but in some cases prone to triggering. They are to be found in particular in gullies and bowls, and behind abrupt changes in the terrain. These are to be avoided as far as possible in particular on shady slopes above approximately 1800 m.
