Avalanche danger

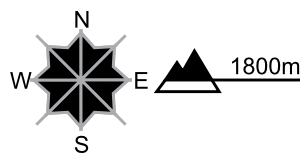

region E

Level 3, considerable

Fresh snow and snow drifts

Avalanche prone locations

Danger description

As a consequence of fresh snow and wind snow drift accumulations will form. These are mostly small but can be released easily. They are to be found in particular in gullies and bowls, and behind abrupt changes in the terrain. The snow drift accumulations are to be avoided in steep terrain.

Wet and full-depth avalanches

More full-depth avalanches are possible. These can reach medium size in isolated cases. Areas with glide cracks are to be avoided.

Sotto Ceneri: As a consequence of the rain wet avalanches are to be expected, this applies in particular during the night.
