Avalanche danger

region A

Level 3, considerable

Fresh snow and snow drifts

Avalanche prone locations

Danger description

As a consequence of fresh snow and wind extensive snow drift accumulations will form. Somewhat older snow drift accumulations are in some cases still prone to triggering. These avalanche prone locations are covered with fresh snow and barely recognisable. Avalanches can be released, even by a single winter sport participant and reach medium size. As the day progresses individual natural avalanches are possible. Backcountry touring calls for experience in the assessment of avalanche danger and caution.

Wet and full-depth avalanches

At intermediate altitudes more wet avalanches are possible. Full-depth avalanches are also to be expected, especially on east, south and west facing slopes below approximately 2400 m. These can reach medium size.

Danger levels

1 low

2 moderate

3 consider.

4 high

5 very high
