

# Considerable avalanche danger will be encountered over a wide area. Snow drifts require caution

Edition: 4.4.2018, 17:00 / Next update: 5.4.2018, 08:00

## Avalanche danger

### region C

### Level 3, considerable

#### Snow drifts

#### Avalanche prone locations

#### Danger description

As a consequence of the westerly wind easily released snow drift accumulations will form. Somewhat older snow drift accumulations are in some cases still prone to triggering. These avalanche prone locations are covered with fresh snow and barely recognisable. Avalanches can reach medium size in isolated cases. Backcountry touring calls for experience in the assessment of avalanche danger and careful route selection.

#### Wet and full-depth avalanches

At intermediate altitudes more wet avalanches are possible. Full-depth avalanches are also to be expected, especially on east, south and west facing slopes below approximately 2400 m. These can reach medium size.

#### Danger levels

1 low

2 moderate

3 consider.

4 high

5 very high
