Avalanche danger

region D

Level 3, considerable

Snow drifts, old snow

Avalanche prone locations

Danger description

As a consequence of the westerly wind easily released snow drift accumulations will form. Somewhat older snow drift accumulations are in some cases still prone to triggering. Avalanches can additionally in isolated cases be released in deeper layers. This applies in particular on very steep north facing slopes in little used backcountry terrain. Such avalanche prone locations are barely recognisable.

Avalanches can reach medium size. Backcountry touring and other off-piste activities call for experience in the assessment of avalanche danger.

Wet and full-depth avalanches

At intermediate altitudes more wet avalanches are possible. Full-depth avalanches are also to be expected, especially on east, south and west facing slopes below approximately 2400 m. These can reach medium size.
