

Outside marked and open pistes a critical avalanche situation will be encountered in some regions

Edition: 13.4.2018, 08:00 / Next update: 13.4.2018, 17:00

Avalanche danger

region D

Level 2, moderate

Full-depth avalanches

Medium-sized and, in isolated cases, large full-depth avalanches are possible. The avalanche prone locations are to be found in particular on east, south and west facing slopes below approximately 2600 m. Individual avalanche prone locations are to be found also on north facing slopes, in particular below approximately 2400 m. Areas with glide cracks are to be avoided.

Snow drifts

Fresh and somewhat older snow drift accumulations have formed in particular at elevated altitudes. These are mostly small but to be assessed with care and prudence. They are to be found in particular in gullies and bowls, and behind abrupt changes in the terrain. Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.
