

In the early morning a generally favourable avalanche situation will prevail. Full-depth and wet avalanches as the day progresses

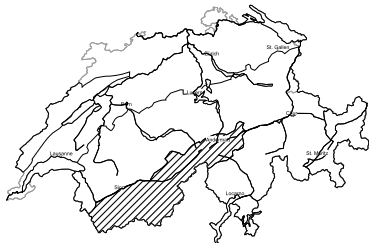

Edition: 16.4.2018, 17:00 / Next update: 17.4.2018, 17:00

Dry avalanches

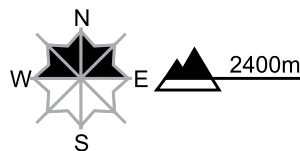

Dry, region C

Level 2, moderate

Avalanche prone locations

Danger description

The near-surface layers of the snowpack can be released in isolated cases and mostly by large additional loads. Additionally in very isolated cases avalanches can release deeper layers of the snowpack and reach dangerously large size. Careful route selection is advisable.

Additional danger: Wet avalanches as day progresses (see 2nd map)
