

In the north a considerable avalanche danger will be encountered over a wide area

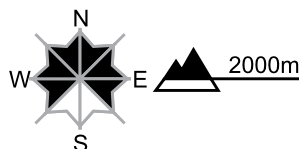

Edition: 19.1.2020, 17:00 / Next update: 20.1.2020, 08:00

Level 2, moderate

Wind slabs

Avalanche prone locations

Danger description

As a consequence of southerly wind, small wind slabs will form in some localities. The fresh snow and wind slabs of the last few days are poorly bonded with the old snowpack in particular on wind-protected shady slopes. Avalanches can in some places be released easily, but they will be small in most cases. Careful route selection is recommended.

Gliding avalanches

Between approximately 2000 and 2600 m individual gliding avalanches are possible, in particular medium-sized ones. They can be released at any time of day or night. Areas with glide cracks are to be avoided as far as possible.

Danger levels

1 low

2 moderate

3 consider.

4 high

5 very high
