

Moderate avalanche danger will be encountered over a wide area. Wet avalanches as the day progresses

Edition: 22.4.2021, 17:00 / Next update: 23.4.2021, 17:00

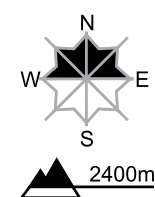

Dry avalanches

Level 2, moderate

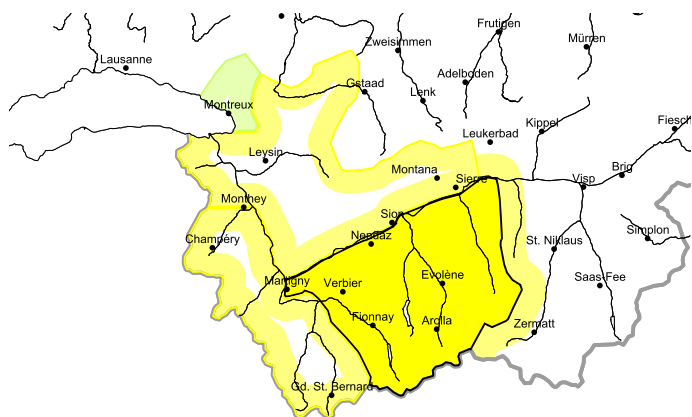

No distinct avalanche problem

Avalanche prone locations

Danger description
Isolated avalanche prone weak layers exist in the top section of the snowpack. Dry avalanches can reach medium size. The avalanche prone locations are difficult to recognise, caution is to be exercised in particular in areas where the snow cover is rather shallow. Apart from the danger of being buried, restraint should be exercised as well in view of the danger of avalanches sweeping people along and giving rise to falls.

Wet avalanches as day progresses

Level 2, moderate

Wet avalanches as day progresses

On very steep sunny slopes more frequent small and medium-sized wet avalanches are to be expected. Backcountry tours should be concluded timely. On grassy slopes individual gliding avalanches are to be expected below approximately 2400 m. These can in isolated cases reach large size.
