

Avalanche danger

Forecast through: 15.4.2024, 17:00 / Next update: 15.4.2024, 17:00

Wet snow, Gliding snow

Avalanche prone locations Danger description

Outgoing longwave radiation during the night will be reduced. Wet avalanches are to be expected, even large ones in isolated cases, especially on sunny slopes below approximately 3000 m, as well as on north facing slopes in particular between approximately 2200 and 2800 m. This applies already in the late morning. In addition medium-sized and large gliding avalanches are to be expected. This applies in particular on steep grassy slopes. The danger of wet and gliding avalanches will already be elevated in the early morning.

Low (1)

No distinct avalanche problem

Dry avalanches can in isolated cases be released in near-surface layers of the snowpack. This applies especially in extremely steep terrain. In the course of the day small wind slabs will form in some localities. This applies in high Alpine regions. Mostly avalanches are small. Apart from the danger of being buried, restraint should be exercised in particular in view of the danger of avalanches sweeping people along and giving rise to falls.

Danger levels

1 low

2 moderate

3 considerable

4 high

5 very high
